

A Rose by any other Name . . . Can grow in your garden!

Roses are notorious for being challenging in Florida. But armed with the right knowledge and materials, you can grow beautiful roses.

1. Only plant roses that are grafted on Fortuniana rootstock. All of Kerby's hybrid teas, grandifloras, floribundas and climbers are always on this long-living, tough rootstock.
2. Plant roses in an area that receives at least 6 hours of direct sunlight.
3. Leave enough space between roses for them to grow and for walking between roses to pick flowers or to spray. Typically space plants 3 to 4 feet from one another.
4. Plan to spray roses. In Florida, roses need to be sprayed weekly or every other week to prevent black spot fungus and insect issues. Preventative sprays are much more effective and keep roses looking beautiful.
5. Prune roses severely in the winter, lightly throughout the rest of the year. Deadheading roses on a regular basis encourages more blooming.

Materials Needed:

Rose bushes (start with what you have room and time for.)

1 Bag of Kerby's Pine Soil per rose bush

1 Kerby's Special Fertilizer

Liquid Systemic Fungicide

Systemic Insect Killer or 2-n-1 Systemic Drench

Pump Sprayer

Sharp Clippers

Gloves (to avoid thorns)

Dig a hole twice as wide as the rootball, but no deeper. Plant rose bushes at the same depth as they were growing in the nursery container. Backfill the hole with Kerby's Pine Soil and water in well. Fertilize with 1 tbsp. of The Kerby's Special two to three weeks after planting. Begin spraying with the Liquid Systemic Fungicide and Systemic Insect Killer (they can be combined in the pump sprayer) after the roses have been planted for two weeks.

Hopefully this will get your rose garden off to a great start. The bouquets of flowers that you pick from your garden will surely reward your hard work.
